Fictional document

Fictional document — demonstration example

This document is produced by the Blue Lemon Agent website to illustrate what an AI agent hands to its users. The companies, matters, amounts and people in it are invented. It has no legal, accounting or commercial value.

Fictional document, produced for demonstration. **A tool that matches files is technically one step from a tool that cross-references all of them.** That step is not taken, and it is not taken by design.

Item	Kept?	Why
The match proposed	Yes	Retracing the path
Agreeing and diverging fields	Yes	Justifying a decision after the fact
The decision taken	Yes	Who decided, and when
The date	Yes	Chronology
Matching between unpaired files	Impossible	No implicit pairing
Profile built by crossing several sources	Impossible	That would be a register of people
Data copied from one file to another	Impossible	The agent writes into no file

How the prohibition holds technically

Mechanism	Effect
Pairing declared pair by pair	Two unpaired files never see each other
No writing, into any file	No data migrates
No global index of people	No point where everything would converge

What that gives you concretely: you can answer a resident asking what is done with their data. The answer is a list of file pairs — written down, short, and true.

To be declared by the authority

Paired files: _____

Retention period for matches and their proofs: _____ months

Nothing is paired by default. A tool shipped with preconfigured pairings would decide on the authority's behalf what should be matched — and that decision is not a technical one.

Scope of this document: the service operated by Blue Lemon Agent. For an agent deployed at your premises, the applicable location is that of the architecture set out in the quotation and verified before commissioning; local execution is announced only for the configuration explicitly described and accepted in the quotation; the applicable isolation depends on the deployment mode set out in the quotation, no dedicated isolation being presumed; the encryption mechanisms in transit and at rest, their components and key management are those documented for the architecture chosen; roles and permissions are configured and accepted for the identities and systems actually connected; the events logged, their content, their retention period and who may access them are defined for the deployment chosen.
